- XenApp 6.0 for Windows Server 2008 R2
- XenApp 6.5 for Windows Server 2008 R2
Introduction

If you publish/stream applications from your Citrix server, you must complete the following steps in order to ensure seamless operation with Webroot SecureAnywhere (WSA).

1. **Create Policy**

   - Log into your WSA management console at [https://my.webrootanywhere.com](https://my.webrootanywhere.com) and select Endpoint **Protection**.

   - Browse to the **Policies** tab.
- Highlight Recommended Defaults and select Copy.

- In the Policy Name field enter Citrix Policy and in the Policy Description field enter Policy for Citrix Servers. Press Create Policy.
- Double-click **Citrix Policy**.

- Under **Basic Configuration**, change **Operate background functions using fewer CPU resources** to **On**.
- Under Self Protection, change **Self Protection Level** to **Minimum**.

- Press **Save Changes** and **Promote Pending Changes to Live**.
2. Update the Registry

**Caution!** This fix requires you to edit the registry. Webroot cannot be held responsible for errors or malfunctions caused by this registry modification.

- Open your registry editor and browse to:

  HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Control\Citrix\wfshell\TWI

- Create a new **String Value (REG_SZ)** and name it **LogoffCheckSysModules**.
- Double-click LogoffCheckSysModules and enter WRSA.exe in the Value data field. Press OK.

3. **Install WSA on your Citrix Server**

For detailed instructions on installing WSA, please visit the Resources section in your management console.

4. **Assign Citrix Policy to your Server**

- In your management console, browse to the Group Management tab.
- Find your Citrix server in the list, select it, and press **Apply Policy to Endpoints**.

- In the drop-down menu, select **Citrix Policy** and press **Apply**.
- On your Citrix Server, right-click on the WSA icon and select Refresh Configuration
