## **Mobile SecureWeb for Android User Guide Overview**

Webroot's SecureWeb for Android offers an advanced web browser with extended security features. SecureWeb gives you the freedom to shop and bank online — all with the confidence that your device will be kept safe from malware and your identity will be protected from phishing sites.

---

## System Requirements for Android

The following describes the system requirements for using Mobile SecureWeb functionality on an Android device.

### Operating Systems

- Android operating system version 4.4 (Kit Kat) or higher.

### Devices

- Android-compatible phones and tablets, including Kindle and Nook.
  - Requires an active internet connection for some features. For a list of these features, [click here](#).
-

## Using Password Management

SecureWeb allows you to view and launch password-managed sites, automatically populate your personal data in website forms, and use the auto-fill function to populate your credentials into a login page.

**Note:** To use password management on your Android device, you must first define password-managed sites. For more information, log in to your Webroot SecureAnywhere account at [my.webrootanywhere.com](https://my.webrootanywhere.com).

### To use password management:

1. From your device's Home panel, tap the **SecureWeb** icon.

Webroot browser opens with Secure Browsing enabled.

2. Use the browser to open a password-managed website.
  3. Tap the **Menu** button on your Android device. The following options display:
    - **AutoFill** — Allows you to populate your login credentials on a site that is not pre-set for auto-fill.
      - When you tap **AutoFill**, the name of your password-managed site displays.
      - Tap the site name to populate the fields with your login credentials.
      - If you defined two different logins for a website, for example, you and your spouse share a banking site, but use different logins for your separate checking accounts, tap **AutoFill** to display the different site definitions, then tap the site name to log in.
    - **Fill Forms** — Displays your predefined form-fill profiles. Tap **Fill Forms**, then select a form-fill profile to populate your personal data into the website fields.
    - **Vault** — Displays all your password-managed sites.
      - To access one of the sites, tap the site name from the Vault. You will be automatically logged in if you specified auto-login for that site.
      - You can view your login credentials for that site by pressing and holding the site name until View Site Details displays.
      - Tap **View Site Details** to see a panel that displays your login credentials and other information about the site definition.
    - **More** — Displays Refresh Sites and Help. If you made recent changes to your password-managed sites from your PC, tap **Refresh Sites** to download the changes to your mobile device.
-

## Using SecureWeb

SecureWeb allows you to safely surf the Internet by blocking malicious websites from loading before you access them.

### To use SecureWeb:

1. From the Home panel, tap the **SecureWeb** icon. A Webroot browser opens with secure browsing enabled.
  2. Use this browser to open websites and receive automatic protection from malware and phishing attempts. If you try to open a website that is known for spreading malware or for phishing, an alert panel gives you the following options:
    - **Continue to site** — Ignore the alert and proceed to the site.
    - **Block this site** — Do not open the site. We recommend that you do not access sites that are categorized as potentially malicious.
    - **Never block this site** — Continue to the site and not be prompted again.
-

# Chapter 2: WSA Mobile SecureWeb for Android Support

To learn more about Webroot's support options and other resources, see the following topic:
